

Problems and thoughts

The problems are (following the flow):

- 1) The button "Check in global watchlist" have to be seen only by the customers who have paid for that. For this one i thought to insert "manually" the button, under determinate condition as follow in dynamic-form.component:

```
dynamic-form.component.html | 1  form-getter.component.html  {} anagrafiche_vr.json 7  {} sondaggi.json  {} sondaggi_somministrati.json 9+  Specification Document AML-Scan Tool.pdf

src > app > oc > dynamic-forms > components > dynamic-form > dynamic-form.component.html > form.p-0.mat-elevation-z2.dynamic-form

Go to component | You, 12 seconds ago | 1 author (You)
1 <form style="margin-left: 1%; margin-right: 1%; width: 98%; margin-bottom: 1%; margin-top: 1%;" [style.background-color]="isQuickAdd? 'whitesmoke'"
2 class="p-0 mat-elevation-z2 dynamic-form" [formGroup]="form" [id]="formName" (submit)="onSubmit($event)"
3 <ng-container *ngForm="let field of fields;" dynamicField [field]="field" [group]="form" [readOnlyPage]="readOnlyPage">
4   </ng-container>
5
6   <button mat-button *ngIf="showKycTechButton" (click)="kycTech()">
7     <mat-icon>update</mat-icon>
8     Check in Global Watchlist
9   </button>
10
11 </form> You, 5 months ago * form-stuff ...
```

or in the menu.component:

```
son TS dynamic-form.component.ts  <> table-view.component.html  TS table-view.component.ts  TS menu.component.ts 1  TS for

src > app > oc > dynamic-forms > components > menu > TS menu.component.ts > MenuComponent
You, 6 seconds ago | 3 authors (byed Leeshan Akhtar and others)

6 @Component({
7   selector: "app-menu",
8   template: `
9     <div align="center" [ngStyle]="{'display': 'inline-block', 'width': '100%'}" [style.padding-top]='15px">
10       <button mat-raised-button color="primary" [disabled]="field.readonly" [matMenuTriggerFor]="matMenu1"
11         [style.width]='100%' [style.height.px]='64' [style.border-radius]='4px' [style.background-color]='#000000'
12         [style.padding]='0px' [style.border]='0.1px solid #144FB7">
13         {{field.label}}<mat-icon>{{field.buttonIcon}}</mat-icon>
14       </button>
15       <mat-menu #matMenu1="matMenu">
16         <ng-container *ngFor="let item of field.menuOptions">
17           <button mat-menu-item (click)="onClick(item)">
18             <span>
19               <mat-icon>{{item.icon}}</mat-icon>
20             </span>{{item.label}}
21           </button>
22         </ng-container>
23         <button mat-menu-item *ngIf="showKycTechButton" (click)="kycTech()">
24           <mat-icon>update</mat-icon>
25           Check in Global Watchlist
26       </button> You, now * Uncommitted changes
27     </mat-menu>
28   </div>
29 `
30   styles: [
31     .checkboxgroup-label-padding {
32       padding-left: 4px;
```

But I like more to wrote into the view's json, so we have to find a way to hide the button when it has to be.

- 2) Once I have more than one registry (person or company) to scan with regulat.io tool, since with this tool I can't post more than one at time, we must launch more time the post. So in the follow example, I have to launch the post 1(the original) + 6 times (of which 3 in "person mode" and 3 in "company mode")

	connected_registry numeric (12)	entity_type character (1)	company_name character varying (240)	name character varying (60)	surname character varying (60)	yob date
1	252	E	SIRMAX SPA	[null]	[null]	[null]
2	254	E	SO.F.TER. SRL	[null]	[null]	[null]
3	253	E	S.L.P. SNC DI MACCHIONI A. E TEI...	[null]	[null]	[null]
4	301	P	[null]	LUCA	NOVATI	1974-02-24
5	300	P	[null]	CRISTIANO	MENEGUS	1963-06-25
6	299	P	[null]	VANIA	SERENA	1990-01-01

So the question is, when should we cycle the procedure?

In form-getter? We should call backendService.getAmlScan more times, I don't think so.

In index.js of regulat lambda? I think so! So here I wrote a for loop over the array connectedRegistries (which is passed by the backendService.getConnectedRegistries).

```
154 //Repeat for all the connectedRegistries, if exists,  
155 for (let i = 0; i < connectedRegistries.length; i++) {
```

- 3) Store correctly the response data in the variable scannedData of lambda which will be passed as a payload in regulat_VPC lambda which will process it. Another related problems are:
- Add to the payload of lambda.invoke another parameters, request_type = 'getAmlScan'.
 - Add to the scannedData the key-value of company,registry and checkId which are passed by the frontend.

Below in regulat lambda:

```
184 scannedData = scannedData + await post(options_getScan, postData_getScan); //How can i do it? scannedData has to be json  
185  
195 //To implement, add into response json these parameters i need in regulat_VPC  
196 scannedData = scannedData.add(company, registry, checkId); You, 20 hours ago • updated  
197  
198 //Call regulat_VPC  
199 response = await lambda.invoke({  
200   FunctionName: 'FUNCTION_NAME',  
201   Payload: scannedData //to change the payload?, how can i pass a requestType? --> 'getAmlScan'  
202 }).promise();
```
